## Home Performance Assessment

Address: 480 Grand Hill  
St Paul, MN 55102

Test Date: February 21, 2013

## Blower Door Testing

480 Grand Hill, St Paul

These test results indicate that the building envelope is experiencing a very high air leakage rate relative to other buildings. "CFM50" represents "cubic feet per minute at -50 Pascals pressure"; "ACH50" represents "air changes per hour at -50 Pascals pressure".

MEASUREMENT	PRE TEST
Air Leakage (CFM50)	14,838
Air Changes (ACH50)	6.1

During this test, two fans were used in order to achieve the maximum building depressurization of -31Pa. A "Can't Reach Fifty Factor" had to be used to *estimate* the building's CFM50 and ACH50.

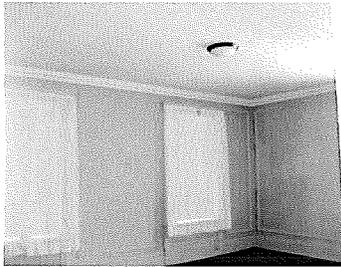

## Infrared Images

480 Grand Hill, St Paul

An infrared camera is used in conjunction with the Blower Door to visually identify and document the specific location of thermal anomalies that indicate air leakage, deficiencies in insulation and moisture. Areas of air leakage through the framing and different window components can be seen in the photos below.

## Discovery & Recommendations

480 Grand Hill, St Paul

Based on the testing results, the following analyses have been made:

### Energy Efficiency & Occupant Comfort

The testing of the windows in 480 Grand Hill with an infrared camera revealed many areas of air leakage around the framing of the window as well as through the different components. Counter weight windows are predominately throughout the house. This style of window is prone to air leakage due to the mechanics and design.

1. There is great potential to increase overall energy efficiency of the house as well as occupant comfort by replacing the original windows and air sealing the open cavities around them.

### Occupant Health & Safety

The windows and doors pre-date 1978 and most likely contain lead-based paint.

2. Conduct a paint inspection and perform lead-abatement or window and door replacement.

Most codes require tempered or safety glazing on windows in hazardous areas such as near a door or close to a walking surface.

3. Replace windows in hazardous areas with tempered glass or glass with safety glazing.

Security of the occupants is a concern with single pane windows due to their breakability and increased chance of forced entrance.

4. Replace single pane windows with stronger, more secure windows.

### Building Durability & Indoor Air Quality

If any substantial energy improvements are done to the house, the original windows will be the primary source of air leakage. Condensation is a likely side effect which is a concern for building durability and indoor air quality.

5. Combat the future building durability and indoor air quality issues by replacing the windows if plans for substantial energy improvements exist.
