5. PLANNING DISTRICT: 13

PRESENT ZONING: T2

6. **ZONING CODE REFERENCE:** § 61.402(c)

7. STAFF REPORT DATE: July 12, 2018

BY: Josh Williams

8. **DATE RECEIVED:** January 31, 2018

DEADLINE FOR ACTION: August 16, 2018

A. PURPOSE: Revised site plan for existing Starbucks store with drive-through sales

B. PARCEL SIZE: approx. 0.43 acres

C. **EXISTING LAND USE:** Starbucks store with drive-through sales (T2)

D. SURROUNDING LAND USE:

North: Industrial/Utility (B3)

East: Railroad (T2) South: Commercial (T2) West: Autobody (T3)

E. **ZONING CODE CITATION**: § 61.402(c)

F. **HISTORY/DISCUSSION:** See Finding 1, below.

G. **DISTRICT COUNCIL RECOMMENDATION:** The Board of the Union Park District Council recommends denial of the application.

H. FINDINGS:

1. The subject property was rezoned to T2 in 2013 as part of a larger, property owner-initiated rezoning associated with the redevelopment of several properties to the south and southeast of the subject property. Other adjacent properties were rezoned in 2017 as a result of the Snelling

Zoning Committee Staff Report Zoning File # 18-026074 Page 2 of 5

Avenue South 40-Acre Study. The Planning Commission approved a conditional use permit for drive-through sales and a variance for floor area ratio (FAR) in late 2015. A site plan for the subject property was conditionally approved by the Zoning Administrator in 2016, and a Certificate of Occupancy for the building was issued in March, 2017, with operations beginning shortly thereafter.

- 2. Since the store began operations in early 2017, City staff have received complaints regarding traffic impacts to Marshall Avenue and the intersection of Snelling and Marshall Avenues, including but not limited to vehicles stopped in the eastbound Marshall vehicular travel lane, vehicles parked or stopped in the eastbound Marshall Avenue bike lane, and vehicles blocking the sidewalk on the southern side (adjacent to the store) of Marshall Avenue. In response to complaints, City staff visited the subject property on numerous occasions throughout the summer and fall of 2017 to observe operations and a traffic monitoring camera was temporarily installed. During this period, staff also began conversations with Starbucks representatives about options for addressing the observed impacts to the public Right-of-Way ("ROW"). In late 2017, the Department of Safety and Inspections sent the Starbucks Corporation a letter describing the observed impacts to the ROW, and ordering Starbucks Corporation to submit a revised site plan for the subject property.
- 3. In August of 2017, in consultation with City staff and at Starbucks expense, collapsible tube delineators (commonly referred to as "bollards") were installed between the bicycle lane and vehicular travel lane in the Marshall Avenue ROW just east of the entrance to the site, and off-duty police officers were hired to direct traffic on and near the site during peak morning hours. Around this time, Starbucks also increased store staffing to improve drive-through operational efficiency.
- 4. In September of 2017, Starbucks commissioned Kimley-Horn to conduct a traffic study to analyze existing drive-through operations and to develop and evaluate both interim and long-term options for site plan modifications to improve operations. An interim site plan was submitted to the City for approval in October, and was implemented in November and December of 2017. The changes included converting the 90-degree parking east of the building to angle parking to encourage one-way circulation for non-drive-through traffic and allow for a separate drive-through queueing lane. Traffic control signage was also changed.
- 5. City, Starbucks, and Kimley-Horn staff met in late September 2017 and again in late November 2017 to review traffic study findings; in each case, City staff requested additional analysis and/or modeling. Starbucks submitted a revised final site plan in early November 2017, and all parties agreed to postpone City action on the site plan following the late November meeting. The revised final site plan was submitted again, along with the requested additional modeling, in early January, and City staff again requested further analysis. Starbucks withdrew the site plan application on January 25th, 2018.
- 6. Kimley-Horn, on behalf of Starbucks, submitted a new revised final site plan application on January 31, 2018. At that time, Starbucks and City staff agreed to postpone any action on the site plan until additional modeling and evaluation of two site plan alternatives could occur. During March and April of 2018, two site plan alternatives were temporarily implemented. For each alternative, traffic was allowed to adjust to the traffic control changes for approximately two weeks after installation, followed by on-site observations and the collection of a week of video of operations. The first alternative tested ("Scenario 1") was the elimination of egress to Marshall Avenue. The intent of Scenario 1 was to enforce one-way site circulation for all vehicles and force exit to northbound Snelling Avenue, thereby eliminating a conflict point for vehicular traffic in the existing site plan where vehicles exiting the drive-through to Marshall Avenue cross the ingress lane for all vehicles entering the site. The scenario had the additional benefit of preventing illegal left turns from the site to westbound Marshall Avenue, which has been observed to include occur approximately 30% of the time when traffic control officers are not

Zoning Committee Staff Report Zoning File # 18-026074 Page 3 of 5

present; these illegal left turns delay the individual vehicles exiting to Marshall Avenue, thereby exacerbating the adverse impacts of the conflict point on both on- and off-site traffic circulation. The second alternative ("Scenario 2") tested was the placement of a temporary median in Marshall Avenue adjacent to the site. This was accomplished by installing collapsible tube delineators in the Marshall Avenue ROW adjacent to the site, along the double yellow line that separates east- and westbound travel. Like in Scenario 1, the median eliminated the possibility of illegal left turns from the site onto westbound Marshall. It did, however, allow vehicles to continue to exit the site to eastbound Marshall, thereby not eliminating the conflict point just inside the Marshall Avenue ingress/egress. In addition, the simulated median prevented vehicles travelling westbound on Marshall from entering the site.

- 7. In a memorandum dated May 17, 2018, Kimley-Horn provided to City staff analysis of the alternatives tested and a summary of the traffic data gathered during the testing period. The unsummarized data was also provided, as an appendix to the document. For purposes of comparison, observations from August 2017 were also provided. All traffic volumes cited herein were observed on a Friday (Starbucks highest volume day of the week) unless otherwise stated. Customer volumes exceeded expectations at the time the store opened in early 2017, and drive-through volumes have generally continued to increase since that time. On August 25, 2017, a.m. peak hour traffic (8 a.m. to 9 a.m.) was approximately 80 vehicles, of which 60 used the drive-through. For the two scenarios tested in Spring 2018, observed a.m. peak hour traffic was 100 vehicles for scenario 1 (7 a.m. to 8 a.m.) and 110 hours for scenario 2 (7:30 a.m. to 8:30 a.m.).
- 8. Observations of "spillback" events, where vehicle have temporarily backed the Marshall Avenue ROW when unable to enter the site due to on-site congestion, suggest that there have been marginal improvements in site operational efficiency. While the observations made August 2017 and March/April 2018 differ in terms of the data points collected and how they are summarized, they are generally comparable. On Friday, August 25, 2018, an estimated 10 "spillback" events where vehicular traffic temporarily blocked portions of the Marshall Avenue ROW were observed between 7 and 9 a.m.. Under Scenario 1 tested in April 2018, a total of 24 spillback events were observed over a 4-day week (excluding Wednesday) and under Scenario 2 a total of 20 events were observed over the same period. Under Scenario 2, the total average time of ROW obstruction was lesser (60 seconds per event) as compared to Scenario 1 (82 seconds per event); no data on length of spillback events in August 2017 was provided. In all cases, an off-duty police officer was employed by Starbucks during the observation period to direct traffic on and near the site.
- 9. Section 61.202(c) of the Saint Paul Zoning Code allows the Planning Commission to delegate approval and denial of site plan applications to the Zoning Administrator. The existing site plan was conditionally approved by the Zoning Administrator in 2016. In In approving the existing site plan, the Zoning Administrator found the plan to be consistent with the Zoning Code, including Section 61.402(c), which lists findings which a site plan must meet. The proposed modifications to the existing site plan are limited in scope and involve reconfiguration of parking and the drive-through queueing area, with some parking converted to use for drive-through queueing. Consistency with Section 62.108(c) is best evaluated with regard to how the proposed amended site plan differs from the existing, approved site plan. Section 62.108(c) requires the following findings:
 - (1) The city's adopted comprehensive plan and development or project plans for sub-areas of the city.
 - (2) Applicable ordinances of the City of Saint Paul.
 - (3) Preservation of unique geologic, geographic or historically significant characteristics of the city and environmentally sensitive areas.
 - (4) Protection of adjacent and neighboring properties through reasonable provision for such

Zoning Committee Staff Report Zoning File # 18-026074 Page 4 of 5

matters as surface water drainage, sound and sight buffers, preservation of views, light and air, and those aspects of design which may have substantial effects on neighboring land uses.

- (5) The arrangement of buildings, uses and facilities of the proposed development in order to assure abutting property and/or its occupants will not be unreasonably affected.
- (6) Creation of energy-conserving design through landscaping and location, orientation and elevation of structures.
- (7) Safety and convenience of both vehicular and pedestrian traffic both within the site and in relation to access streets, including traffic circulation features, the locations and design of entrances and exits and parking areas within the site.
- (8) The satisfactory availability and capacity of storm and sanitary sewers, including solutions to any drainage problems in the area of the development.
- (9) Sufficient landscaping, fences, walls and parking necessary to meet the above objectives.
- (10) Site accessibility in accordance with the provisions of the Americans with Disabilities Act (ADA), including parking spaces, passenger loading zones and accessible routes.
- (11) Provision for erosion and sediment control as specified in the ``Ramsey Erosion Sediment and Control Handbook."

With regard to findings 61.204(c) (1-6) and (8-11), the proposed amendment is substantially similar or identical to the existing, approved site. With regard to finding 61.204(c) (7), the proposed amended site plan is equally or more consistent with the finding as the existing site plan. The proposed amended site plan would provide additional on-site queueing for drivethrough traffic (increasing from 9-10 spaces with the current site configuration to 10-11 with the proposed modified site plan, and facilitates overall site circulation by allowing for increased separation of drive-through traffic from vehicles accessing off-street parking. While the increase in queueing and maneuvering room is limited, it is an improvement relative to the current site configuration on a site that is physically constrained by a number of factors. With continued presence of a traffic control officer to assist with on-site operations during the a.m. peak period, the proposed amended site plan should lead to a reduction in impacts to the ROW and the safety concerns associated with those impacts. Continued presence of a traffic control officer to assist with traffic operations on the site should be a condition of approval, with the option for the applicant to return to the Planning Commission to request modification of that condition if it can be demonstrated that any modification of the condition will not adversely impact site operations or public safety.

10. The May 17, 2018 traffic study submitted on behalf of the applicant recommended that Scenario 2, which tested the possibility of a new median in Marshall Avenue adjacent to the site, be implemented, and submitted a concept plan for changes to the Marshall Avenue ROW to accommodate a new median and additional on-street parking. The feasibility of these changes have not been fully evaluated at this time, and action in regard to these proposed changes in the ROW is therefore not prudent at this time. However, reinstallation of collapsible tubes in the Marshall Avenue ROW on an interim basis to simulate a permanent median should be a condition of approval. The installation must be approved by the road authority for Marshall Avenue, understood to be Ramsey County or the State of Minnesota. The collapsible tubes will be removed on a seasonal basis to allow for snow removal, and will be permanently removed at such time as any significant reconfiguration of the Marshall Avenue ROW near the site is undertaken.

I. STAFF RECOMMENDATION:

Based on the findings above, the staff recommends approval of the amended site plan for the existing Starbucks coffee shop with drive-through sales at 234 Snelling Ave N., subject to the

Zoning Committee Staff Report Zoning File # 18-026074 Page 5 of 5

following conditions:

- 1. The applicant will provide, at their expense, a traffic control officer to direct vehicular traffic on the site during the AM peak period. This condition may be modified in the future by the Planning Commission if the applicant can demonstrate that any modification will not adversely site operations or public safety.
- 2. Installation of collapsible tubes in the Marshall Avenue ROW, on an interim basis, to simulate the presence of a physical barrier in the median. The installation is not required if not approved by the road authority, which is understood to be either Ramsey County or the State of Minnesota. The collapsible tubes will be removed on a seasonal basis to allow for snow removal, and will be permanently removed at such time as any significant reconfiguration of the Marshall Avenue ROW near the site is undertaken.

ZONING COMMITTEE ACTION:

Recommended approval with conditions on Sept. 10, 2015

PLANNING COMMISSION ACTION:

Approved with conditions on September 18, 2015

CONDITIONS OF THIS PERMIT:

Standard conditions specified in Sec. 61.501; Sec. 65.513; and the following additional conditions:

Final plans approved by the Zoning Administrator for this use shall be in substantial compliance with the plan submitted and approved as part of this application.

Incorporation into the building and site design of horizontal and vertical elements that visually extend the building to encompass the proposed patio and seating area on the south side of the building and that visually enclose and separate said patio and seating area from the Snelling Avenue ROW.

Site plan approval.

Saint Paul Public Works review and approval of proposed use and site plan in regard to adequacy of drive-through stacking, ingress and egress, and pedestrian and cyclist safety, as evidenced by site plan approval.

The hours of operation of the drive-through service shall be no earlier than 5:30 am to no later than 10:00 pm.

APPROVED BY:

Barbara Wencl, Commission Chairperson

I, the undersigned Secretary to the Zoning Committee of the Planning Commission for City of Saint Paul, Minnesota, do hereby certify that I have compared the foregoing copy with the original record in my office; and find the same to be a true and correct copy of said original and of the whole thereof, as based on minutes of the Saint Paul Planning Commission meeting held on September 18, 2015, and on record in the Saint Paul Planning Office, 25 West Fourth Street, Saint Paul, Minnesota.

This permit will expire two years from the date of approval if the use herein permitted is not established, subject to administrative extension not to exceed one year (§ 61.105). If one of the following occurs, the use herein permitted shall automatically expire: the use is established but subsequently is discontinued for 365 days or is replaced by another use, the lot area is reduced, or as otherwise provided in § 61.505.

The decision to grant this permit by the Planning Commission is an administrative action subject to appeal to the City Council. Anyone affected by this action may appeal this decision by filing the appropriate application and fee at the Zoning Office, 1400 City Hall Annex, 25 West Fourth Street. Any such appeal must be filed within 10 calendar days of the date of the Planning Commission's decision.

Violation of the conditions of this permit may result in its revocation.

No.	REVISIONS	DATE	BY

November 21, 2017

Donna Drummond, Director of Planning, PED Larry Zangs, Site Plan Review Coordinator, DSI City of Saint Paul 25 West 4th Street St. Paul, MN 55102

Dear Donna and Larry:

On November 20, the Union Park District Council Committee on Land Use and Economic Development discussed the Revised Site Plan, Amended Traffic Narrative, and Traffic Operations Summary submitted by Starbucks for its drive-through location at 234 North Snelling Avenue, along with input from City staff.

At that meeting, the Committee voted to endorsed the same resolution passed last week by the Union Park Transportation Committee. The language of that recommendation is provided below in full.

The Committee recommends denial of the Revised Site Plan. The proposed measures in the interim and long-term plans do not address the concerns of the community.

The Committee believes that the proposed additional queueing spaces on the site will **not be adequate** to meet the observed demand and therefore will not eliminate obstructions of the right-of-way caused by queuing vehicles.

Through their collective observations and numerous experiences with the site, Committee members and attendees agreed that there are frequently over three or four vehicles queueing within the public right-of-way—blocking the sidewalk, bicycle lane, and traffic lanes on Marshall and Snelling Avenues. Moreover, Starbucks' limited observations do not account for drivers who choose to avoid waiting in the queue completely, because there is simply no space left in the right-of-way to wait.

The Committee further believes that the anticipated vehicle movements in the interim plan are not manageable, and it urges the City to collect observational data on the functioning of the interim plan before approving the long-term plan.

In short, the Committee concluded that neither the interim nor the long-term plan provides adequate queuing space to meet the demand without obstruction the right-of-way, in a location where a drive-through poses serious safety concerns.

Through this resolution, the Committee is urging the City of Saint Paul to deny this Revised Site Plan and withdraw its Conditional Use Permit for operation of the drive-through.

Sincerely,

Julie Reiter

Julie Reiter, Executive Director Union Park District Council

UNION PARK DISTRICT COUNCIL

161 Snelling Avenue North, Saint Paul, MN 55104 651.645.6887 | info@unionparkdc.org | www.unionparkdc.org An Affirmative Action, Equal Opportunity Employer

December 15, 2017

Donna Drummond, Director of Planning, PED Larry Zangs, Site Plan Review Coordinator, DSI City of Saint Paul 25 West 4th Street St. Paul, MN 55102

Dear Donna and Larry:

At its regular meeting on December 6, 2017, the Union Park District Council Board voted to endorsed the resolutions related to the revised site plan for the Starbucks drive-through passed by its Transportation Committee on November 14 and its Committee on Land Use and Economic Development on November 21:

The Board recommends denial of the Revised Site Plan. The proposed measures in the interim and long-term plans do not address the concerns of the community.

It is our understanding that Starbucks will be submitting a second revised site plan to the City soon. The Board nonetheless passed this resolution to affirm that 1) the interim plan as it has been implemented **has not avoided** obstructions of the right-of-way, and 2) providing only a few additional queueing spaces on the site will **not be adequate** to meet the observed demand, and therefore will not eliminate obstructions of the right-of-way caused by queuing vehicles.

I urge the City to hold Starbucks to its obligation to avoid right-of-way obstruction as outlined in its Conditional Use Permit. If the conditions cannot be met, the permit for operation of the drive-through should be withdrawn.

Sincerely,

Julie Reiter

Josh Williams - City of Saint Paul PED

From: Douglas Arnold, P.E.

Trisha Sieh, P.E.

Date: May 17, 2018

Re: Traffic Analysis Summary

Starbucks (Snelling Avenue and Marshall Avenue)

Saint Paul, Minnesota

Introduction

A Conditional Use Permit for drive-through sales was issued in 2015 for the Starbucks building at 234 Snelling Avenue, with Site Plan approval following in May of 2016. Since store opening in February 2017, this Starbucks has outperformed the anticipates sales volumes and hence the store is experiencing more drive-through trips than expected. At certain times of the day, the drive-through queue has caused occasional back-ups onto Marshall Avenue. Additionally, some vehicles choose to exit left onto Marshall Avenue, which is not a permitted movement.

Starbucks and their project team have been actively and cooperatively working with the City since June 14, 2017, which has culminated in the submittal of the enclosed Site Plan Amendment. Starbucks has taken several actions to reduce the off-site backups and limit traffic congestion. The following memorandum provides a summary of actions taken to date, including interim site plan changes and access testing.

Coordination with City Staff

Starbucks have been very engaged with the City since the store has opened to help address the traffic concerns. Starbucks understands and acknowledges that the City and neighbors want, and deserve, to see improvements that will address the City and neighborhood's concerns and ensure a safe and inviting store for Starbuck's customers, the neighborhood, and public to enjoy.

The existing approved site plan for the property was driven by the site plan review standards under the City Code. During the initial development phase of the property, Starbucks proposed several drive-through and site designs that would have increased on-site queueing beyond the current site plan and minimized (or eliminated) spillback onto Marshall Avenue and any weaving conditions at the Marshall Avenue driveway. These design alternatives were ultimately rejected and the current site layout moved forward.

Starbucks is currently in compliance with the existing Conditional Use Permit (CUP) and Site Plan Review approvals. However, Starbucks is amendable to site plan modifications that will improve traffic on-site and on local streets, and has applied for the enclosed Site Plan Amendment in an effort to work collaboratively with the City.

Below is a timeline of actions taken by Starbucks and the City to improve site operations since store opening in February 2017:

August 2017

- o City installed tube delineators to protect the on-street bike lane, at Starbucks expense.
- Starbucks hired an off-duty police officer to control traffic during peak morning hours, entirely at Starbucks expense.
- Starbucks increased staffing to ensure drive-through window times were lower than system average, thereby increasing efficiency of the drive-through and reducing potential back-ups.

September 2017

- Starbucks commissioned a traffic study to evaluate the current site queueing operations and assess how potential site configurations would affect traffic patterns.
- Starbucks developed several site plan options for both interim and longer term solutions.
- On September 29th, Starbucks and Kimley-Horn met with City staff from PED, PW, and DSI to discuss the results of the traffic study, and evaluate interim and longer term solutions to resolve traffic issues. Additional analysis was requested by the City.

October 2017

o On October 19th, Starbucks submitted an Interim Site Plan to the City for approval.

November 2017

- o On November 2nd, Starbucks submitted a revised final Site Plan Amendment package, including additional site plan traffic modeling requested by City staff.
- o On November 6th, Starbucks began implementing some of the Interim Site Plan improvements by restriping the eastern parking row from 90 degrees to angled parking to create one way circulation and dedicated drive-through queue lane.
- On November 30th, Starbucks and Kimley-Horn met with PED, PW, and DSI staff to discuss additional modeling and revised site plan. Starbucks agreed to provide further additional modeling.

December 2017

o On December 18th, Starbucks installed the traffic control signage as part of the Interim Site Plan improvements.

January 2018

- o On January 8th, Starbucks submitted a revised Site Plan Amendment along with additional modeling requested by City staff.
- On January 17th, Starbucks and Kimley-Horn met with PED, PW, and DSI staff to discuss additional modeling and alternative site plan modifications. Starbucks agrees to provide further analysis of vehicle movements.
- o On January 25th, Starbucks withdrew the Site Plan Amendment application with intent to resubmit.
- o On January 31st, Starbucks submitted a revised final Site Plan Amendment package, with the intent to supplement with additional modeling.

As a result of the January 31st Site Plan Amendment package submittal, Starbucks and Kimley-Horn worked with City staff to develop a plan to test different access configurations on site, including testing the closure of the Marshall Avenue access and testing a temporary median along Marshall Avenue. In coordination with the City, two access scenarios were tested; Scenario 1 consisted of closing the Marshall Avenue exit, resulting in all traffic forced to exit onto Snelling Avenue, and Scenario 2 consisted of installing bollards along Marshall Avenue to prohibit left-turn into and out of the site along Marshall Avenue (simulating a raised center median on Marshall Avenue), while maintaining the right-turn exit onto Marshall Avenue. Following provides a timeline of the access alternative testing, where each test had a two-week period to allow traffic to normalize to the new circulation pattern, and one week of observations:

Scenario 1

- o Temporary traffic control set-up from March 19, 2018 through April 8, 2018.
- Video recording and observations from April 4, 2018 through April 8, 2018.

Scenario 2

- o Temporary traffic control set-up from April 9, 2018 through April 28, 2018.
- Video recording and observations from April 3, 2018 through April 28, 2018.

More detailed information on the previous traffic studies, as well as an in-depth analysis of the scenario testing is provided later in this memo.

Summary of Previous Traffic Analysis (2017)

As previously mentioned, a traffic analysis was performed in the fall of 2017 to quantify site operating conditions, including the amount of traffic generated by the site, the drive-through operations, and drive-through vehicle queueing and how that was impacting operations along Marshall Avenue. Following is a summary of the November 2017 analysis:

The site generated approximately 160 AM peak hour trips (80 entering and 80 exiting). All traffic entered the site from Marshall Avenue, while approximately 65% of the traffic exited the site to Marshall Avenue and 35% of the traffic exited the site to Snelling Avenue.

- The site accommodated approximately nine (9) vehicles on site.
- The maximum drive-through queue was observed to be twelve (12) vehicles with an average queue of seven (7) vehicles.
- There were approximately ten (10) events from 7:00 AM to 9:00 AM where the drive-through queue spilled back onto Marshall Avenue.

An addendum to the November 2017 traffic memo was submitted to the City on January 8, 2018 to assess the site circulation as a result of the Interim Site Plan changes. The supplemental analysis reviewed vehicle circulation, number of trips generated by the site, and queueing. Following is a summary of the January 2018 analysis:

- The site generated approximately 180 AM peak hour trips (90 entering and 90 exiting). All traffic entered the site from Marshall Avenue, while approximately 70% of the traffic exited the site to Marshall Avenue and 30% of the traffic exited the site to Snelling Avenue.
- The maximum drive-through queue was observed to be eleven (11) vehicles.

Both memos are provided as an **Attachment**.

Access Alternatives Testing (2018)

As previously mentioned, in coordination with the City, Starbucks tested two access scenarios. Video data was recorded, in conjunction with multiple field observations, in order to analyze the two scenarios. The City of Saint Paul independently recorded video and analyzed drive-through operations for both access scenario tests.

The following section provides an in-depth summary of the two access scenarios that were tested in the Spring of 2018.

Field Observations

- Scenario 1 (Closure of Marshall Avenue Exit)
 - There was a lot of confusion when the test was first implemented since all traffic was forced to exit onto Snelling Avenue.
 - After the first day of implementing the access test, a second officer was added to help control traffic on site.
 - A number of vehicles were observed to exit onto Marshall Avenue from the entry lane.
 - There were times where the exit queue at Snelling Avenue approach the drive-through entry.
 - During the observation period (04/02 through 04/06), there was a snow storm event on the Tuesday that impacted afternoon business and morning business on Wednesday.
 - The site was able to accommodate a maximum of ten (10) vehicles, with some instances where eleven (11) vehicles were queued on site.
 - Based on discussion with Starbucks store staff, a slight decrease in sales was observed during this testing period.

- Scenario 2 (Median along Marshall Avenue)
 - Observations showed that on site circulation was generally better because exiting vehicles had a choice to exit onto Snelling Avenue or Marshall Avenue, similar to existing conditions.
 - One police officer was on-site to control traffic.
 - A few vehicles were observed to enter the site from westbound Marshall Avenue through the exit lane.
 - The exit queue onto Snelling Avenue never approached the drive-through entry.
 - The site could accommodate a maximum of ten (10) vehicles, with some instances where eleven (11) vehicles were queued on site.
 - Based on conversations with St. Paul police that were assigned to traffic control, Scenario
 2 operated better and more efficiently as compared to Scenario 1.
 - Based on discussion with Starbucks store staff, customers were more receptive to Scenario
 2 than Scenario 1.

AM Peak Hour Traffic Volumes

Turning movement counts were performed during the Friday AM peak period to determine the number of vehicle entering and exiting the Starbucks development. Counts were performed for both scenarios.

Based on the counts, there were a total of 100 vehicles entering the site from eastbound Marshall Avenue and 95 vehicles exiting onto Snelling Avenue for Scenario 1. For Scenario 2, there were 110 vehicles entering the site from eastbound Marshall Avenue, 45 vehicles exiting onto Snelling Avenue, and 70 vehicles exiting onto Marshall Avenue. Based on the traffic counts, the site accommodated more traffic during the Friday AM peak hour during Scenario 2 testing (110 vehicles) as compared to Scenario 1 testing (100 vehicles).

In order to provide some level of comparison, traffic counts were collected in December 2017 after the interim site plan changes were implemented. Based on those traffic counts, there were a total of 90 vehicles entering the site from eastbound Marshall Avenue, 30 vehicles exiting onto Snelling Avenue, and 60 vehicles exiting onto Marshall Avenue.

Drive-Through Vehicle Queues

Drive-through queues were quantified during the Friday AM peak period (7:00 AM to 10:00 AM), which is traditionally the busiest day of the week for Starbucks. Queue information was recorded for one minute intervals during the three-hour period, April 6th for Scenario 1 and April 27th for Scenario 2. These queues were quantified to determine the maximum amount of vehicle storage on site that is needed to accommodate the drive-through queues. Based on field observations, the maximum number of vehicles able to queue on site without impacting Marshall Avenue was ten (10) vehicles, with eleven (11) vehicles stored on site a portion of the time. This is an improvement from the nine (9) vehicles that were previously observed to stack on site before the Interim Site Plan changes were in place.

Table 1 provides a summary of the maximum, average, and 95th percentile queues, reported as the number of vehicles. Based on the analysis of the Friday AM peak period, Scenario 1 resulted in a longer queue as compared to Scenario 2. For Scenario 1, the 95th percentile queue was twelve (12) vehicles, whereas the 95th percentile queue for Scenario 2 was nine (9) vehicles.

Scenario 1 Scenario 2 (Closure of Marshall Avenue Exit) (Restricted Marshall Avenue Exit) **Time Period** 95th Avg. Max Max 95th Avg. 7:00 AM to 8:00 AM 7 14 13 6 11 8:00 AM to 9:00 AM 6 10 10 6 10 9 9:00 AM to 10:00 AM 9 15 7 13 9 9 7:00 AM to 10:00 AM 8 15 12 11 9

Table 1: Drive-Through Queue Summary (# of Vehicles)

As a comparison to the traffic data collected in December 2017, Scenario 1 resulted in a longer maximum queue (fifteen (15) vehicles vs. eleven (11) vehicles), while Scenario 2 resulting in a shorter maximum queue (nine (9) vehicles vs. eleven (11) vehicles). It should be noted that the average and maximum queue was lower as part of Scenario 2 even though it generated more trips during the AM peak hour than Scenario 1.

Marshall Avenue Queue Spillback

A more thorough analysis was performed to quantify the number of times that the drive-through queue exceeded the existing on-site storage and impeded operations of eastbound vehicle and bicycle traffic along Marshall Avenue. For Scenario 1, the queue spillback was reviewed from 7:00 AM to 10:00 from Monday, April 2, 2018 through Friday, April 6, 2018. For Scenario 2, the queue spillback was reviewed from 7:00 AM to 10:00 from Monday, April 23, 2018 through Friday, April 27, 2018.

There was a major snow storm event in Saint Paul during the afternoon/evening of Tuesday, April 3rd that impacted the morning commute on Wednesday, April 4th during the Scenario 1 testing. Wednesdays are generally a slower day of the week for Starbucks sales. Therefore, Wednesday was excluded in order to provide an accurate comparison of the two scenarios.

Table 2 provides a summary of the number of spillback events, and total blockage time, for each of the two scenarios. As shown, the number of spillback events and the total duration of the spillback events were more for Scenario 1 as compared to Scenario 2. The 95th percentile queue on Marshall Avenue was longer for Scenario 1 as compared to Scenario 2 (four (4) vehicles vs. three (3) vehicles).

Table 2: Summary of Marshall Avenue Queue Spillback Events

Time Period	(C		nario 1 shall Avenue	Exit)	(R		nario 2 shall Avenue	Exit)
(7:00 AM to 10:00 AM)	# of Events	Total Duration (seconds)	Avg. Time per Event (seconds)	95 th Queue (# of vehicles)	# of Events	Total Duration (seconds)	Avg. Time per Event (seconds)	95 th Queue (# of vehicles)
Mon (04/02, 04/23)	3	406	135	5	8	494	62	3
Tues 04/03, 04/24)	6	161	27	2	9	551	61	3
Thurs (04/05, 04/26)	2	120	60	3	1	22	22	1
Fri (04/06, 04/27)	13	1,279	98	3	2	130	65	3
Total	24	1,966	82	4	20	1,197	60	3

Note: Wednesday was excluded from the summary due to the snow storm on 04/04.

As part of the spillback analysis, the impacts to the bike lane were summarized. Due to the fact that Scenario 1 was performed during winter conditions, there was minimal bicycle activity along Marshall Avenue. For Scenario 2, there were eight (8) events over the course of the week where a bike was travelling along Marshal Avenue and the bike lane was blocked by a queued vehicle.

Snelling Avenue Exit Queues

Vehicle queues exiting onto Snelling Avenue were quantified during the Friday AM peak period (7:00 AM to 10:00 AM) for both access scenarios. Queues were recorded on a Friday since that is traditionally the busiest day for Starbucks. Queues were reported for each one minute interval from 7:00 AM to 10:00 AM for April 6, 2018 for Scenario 1 and April 27, 2018 for Scenario 2.

These queues were quantified to determine if the additional vehicle demand on the Snelling Avenue would result in vehicle queues that would impact the drive-through operations. **Table 3** provides a summary of the Snelling Avenue exit queues and includes the average queue, maximum queue, and 95th percentile queue (all recorded as the number of vehicles). Although the average queue was less than one (1) vehicle for both scenarios, the maximum queue observed was longer for Scenario 1 as compared to Scenario 2 (five (5) vehicles vs. four (4) vehicle) and the 95th percentile queue was slightly higher for Scenario 1 as compared to Scenario 2 (three (3) vehicles vs. two (2) vehicles).

Table 3: Summary of Snelling Avenue Exit Queues (# of Vehicles)

Time Period	(Closure o	Scenario 1 f Marshall Ave	enue Exit)	(Restricted	Scenario 2 I Marshall Av	enue Exit)
	Avg.	Max	95th	Avg.	Max	95th
7:00 AM to 8:00 AM	<1	5	2	<1	2	1
8:00 AM to 9:00 AM	1	4	3	<1	3	1
9:00 AM to 10:00 AM	<1	4	2	<1	4	2
Total (Morning Peak Period)	<1	5	3	<1	4	2

There is currently 125 feet of storage space on-site from Snelling Avenue to the start of the drive-through. There were occasions during Scenario 1 where the queue exiting onto Snelling Avenue approach the drive-through, which had the potential to create gridlock on site.

Summary of Access Alternatives Testing

Following provides a summary of the access testing:

- The AM peak hour trip generation was approximately 10% higher for Scenario 2 as compared to Scenario 1.
- The drive-through queues were longer for Scenario 1 as compared to Scenario 2. The 95th percentile queue was twelve (12) vehicles for Scenario 1 and nine (9) vehicles for Scenario 2.
- There were more queue spillback events onto Marshall Avenue during Scenario 1 as compared to Scenario 2, and the total duration and maximum number of vehicles queued was also greater in Scenario 1.
- With Scenario 1, there was potential that the queue for exiting vehicles onto Snelling Avenue to impact entry into the drive-through.
- Although the number of vehicles entering the site during the AM peak hour for Scenario 2 was higher than Scenario 1 (110 vehicles vs. 100 vehicles), the drive-through queue was shorter for Scenario 2 as compared to Scenario 1.

Based on the information provided above, Scenario 2 performed better than Scenario 1. Starbucks will work with the City and County to implement median modifications along Marshall Avenue to improve site operations.

On-Site Mitigation Considerations

Working with the City, Starbucks has developed a revised site plan that addresses operational deficiencies that are occurring on-site. These improvements build upon the Interim Site Plan improvements that have already been implemented, and are in addition to the proposed median modifications described above. The major change will be to extend the drive-through to the south to provide more on-site storage of queueing vehicles. With the changes, it is anticipated that an additional two vehicles will be able to queue on site, which brings the total vehicle storage on site to twelve (12) vehicles, with an additional space between the sidewalk and the roadway.

The access testing showed that the during the Friday AM peak hour, the maximum queue for Scenario 2 (preferred scenario) was eleven (11) vehicles while the 95th percentile queue was nine (9) vehicles. Based on this information, the proposed site plan changes that will provide storage of twelve (12) will accommodate the Scenario 2 observed queues.

With the extension of the drive-through, there is approximately 100 feet of storage for vehicles exiting onto Snelling Avenue before the queue would begin to impact operations of the drive-through. Based on the analysis for Scenario 2, the maximum exit queue onto Snelling Avenue is not anticipated to impact entry into the drive-through.

Conclusions

Starbucks has worked extensively with the City of Saint Paul over the last nine months to develop solutions that minimize the impacts of the on-site operations on the public roadway network. As a result of the access testing, it is recommended that Scenario 2 be implemented. Furthermore, with the proposed site plan changes that will increase on-site storage, the drive-through queue is not expected to impact bicycle and vehicle operations along Marshall Avenue.

Re: Traffic Operations Summary - Starbucks (Snelling Avenue and Marshall Avenue)

Saint Paul, Minnesota

Executive Summary

A 2,150 square foot Starbucks coffee shop with drive-through was constructed on the southeast corner of Snelling Avenue & Marshall Avenue in 2016. Since opening, the store has been outperforming market projections. As a result, there are instances throughout the day where the available drive-through vehicle queue storage on site is unable to accommodate the vehicle demand. Field observations were performed on Friday, August 25, 2017 to review existing drive-through operations. Based on the review, there average vehicle queue was seven (7) vehicles during the morning peak hour, with a maximum vehicle queue of twelve (12) vehicles. The current site can accommodate up to eight (8) to nine (9) vehicles on site.

As a result of the drive-through operations, Starbucks and Kimley-Horn have been working with City staff to make modifications to the site layout to provide more on-site storage and eliminate queueing on the adjacent public roadway network. Following provides a summary of the proposed site plan changes:

- Proposed Interim Site Plan Restripe the parking spaces and drive-aisle on the east side of the site to angled parking to create one way site circulation, improve parking maneuvering times, and allow for a dedicated drive-through queue lane on the far east side of the site. With these changes, the site will be able to accommodate ten (10) vehicles with single lane stacking and fourteen (14) vehicles with double stacking.
- Proposed (long-term) Site Plan In addition to restriping the parking spaces and drive-aisle on the east side of the site, the drive-through queue lane will be extended further south to provide more stacking. With the proposed long term site plan changes, the site will be able to accommodate eleven (12) vehicles on site with single lane stacking, removing impacts to the public roadway system. Six (6) parking stalls on the south side of Marshall, east of the Starbucks driveway entrance would be stripped.

Introduction

A 2,150 square foot Starbucks coffee shop with drive-through was constructed on the southeast corner of Snelling Avenue & Marshall Avenue in 2016. Since opening, the store has been outperforming market projections. As a result, there are instances throughout the day where the available drivethrough vehicle queue storage on site is unable to accommodate the vehicle demand.

Starbucks representatives have been working closely with City of Saint Paul staff to design and implement changes to the site layout to minimize the impact of site generated traffic on the public roadway network.

Based on scoping discussions with City staff, Kimley-Horn has prepared a traffic technical memorandum. The purpose of the memo is to summarize existing operating conditions of the Starbucks restaurant and the signalized intersection of Snelling Avenue & Marshall Avenue, as well as provide justification for the proposed changes to the site layout.

Existing Conditions

Existing operating conditions of the Starbucks coffee shop and surrounding roadway network was reviewed on Friday, August 25, 2017. This included site observations during the AM peak period, turning movement counts and capacity analysis at the intersection of Snelling Avenue & Marshall Avenue, and a summary of drive-through vehicle queueing and processing time.

Based on information provided by Starbucks, Fridays are historically the busiest day. Table 1 provides a summary of drive-through customer occasions through September 2017. As shown in the table, the site generates +/- 70% more traffic on a Friday than the average day during the morning peak period. The historical Friday peak drive-through customer occasions are consistent with what was observed on Friday, August 25, 2017.

TABLE 1: DRIVE-THROUGH OCCASIONS

Time Period	Average Morning Peak Period Drive-Through Customer Occasions (Year 2017)	Friday Morning Peak Period Drive-Through Customer Occasions (Year 2017)
6:00 AM to 7:00 AM	21	37
7:00 AM to 8:00 AM	33	64
8:00 AM to 9:00 AM	36	60
9:00 AM to 10:00 AM	35	58
10:00 AM to 11:00 AM	30	48
Total (Morning Peak Period)	155	267

Existing Observations

Site observations were performed during the AM peak period (7:00 AM to 9:00 AM) on Friday, August 25, 2017. Following provides a summary of the observations.

- For the most part, vehicles did not block the sidewalk when the queues reached the south end of the parking lot.
- There were instances where the drive-through queue spilled back into Marshall Avenue. When
 that occurred, vehicles would queue in the existing bike lane allowing for eastbound traffic to
 continue along Marshall Avenue. The maximum number of vehicles queued on the roadway as
 three during the AM peak period.
- The layout of the parking lot, in particular the 90 degree parking spaces, caused interruptions to the drive-through operations when motorists pulled into and/or out of those parking spaces along the east side of the building.
- A number of vehicles leaving the drive-through proceeding to leave the site via Marshall Avenue by making a northbound left-turn movement, which is prohibited based on current signing.

On Site Drive-Through Operations

Kimley-Horn collected drive through data on Friday, August 25, 2017 during the AM peak period (7:00 AM to 9:00 AM) which is anticipated to be the busiest time for the drive-through. Information collected includes processing time and vehicle queue lengths.

Processing Time

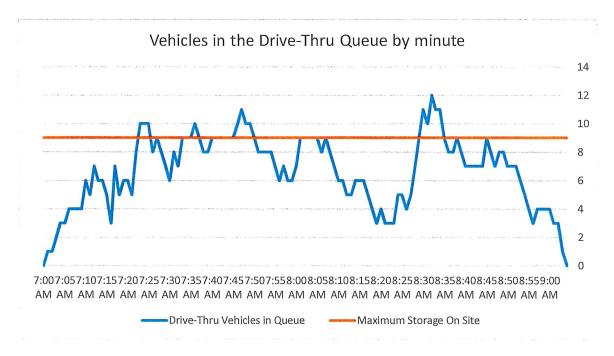

Data was collected that quantified the time it took to process an order, which was assumed to be from when a vehicle arrived at the order board to when the same vehicle left the pickup window. Based on the data collected, **the average processing time was approximately 2 minutes and 45 seconds**. The minimum processing time was 1 minute and 21 seconds and the maximum processing time was 4 minutes and 47 seconds. A table is provided as an attachment that provides the processing time for each vehicle that used the drive-through during the AM peak period.

Based on discussion with Starbucks staff, one way to improve processing time is to provide more storage between the order board and the pick-up window. Currently there is enough space to allow for approximately four vehicles. Based on previous experience at existing stores, optimal storage is for five vehicles.

Drive-Through Vehicle Queue

The vehicle queue for the drive-through was measured every minute during the two-hour AM peak period. The following graph shows a visual representation of how the vehicle queue varied during the AM peak period.

Based on the data collected, the maximum queue observed was twelve (12) vehicles, with the average queue being seven (7) vehicles. Currently, the site provides enough storage for eight (8) vehicles on site without impacting the operations of the Marshall Avenue (including the bike lane sidewalk on the southside of the roadway), which is typically sufficient for Starbuck's projected operations. This Starbucks café is out-performing projections and, based on the data collected, is generating approximately 10% more drive-through traffic than typical.

Intersection Operations at Snelling Avenue & Marshall Avenue

Intersection turning movements were collected at the intersection of Snelling Avenue & Marshall Avenue on Thursday, September 7, 2017 during the AM and PM peak periods. These counts include traffic generated by the Starbucks development. **Table 1** provides a summary of the AM and PM peak hour turning movement volumes. The turning movement volumes are provided as an attachment.

TABLE 1: EXISTING TURNING MOVEMENT VOLUMES (SEPT 2017)

Peak Hour		Northboui	nd		Southbour	nd	Ec	istbound	d	и	estboui/	nd
	LT	TH	RT	LT	ТН	RT	LT	TH	RT	LT	TH	RT
AM	50	1,485	65	50	1,025	150	290	210	50	50	265	125
PM	60	1,105	110	45	1,415	175	180	395	95	135	325	70

Using Synchro/SimTraffic, the intersection was analyzed to determine overall intersection delay and level of service with the Starbucks traffic during normal weekday conditions. Additionally, the westbound approach was analyzed further to determine the 95th percentile queue lengths for the through and left-turn movements. **Table 2** provides a summary of the capacity analysis. Based on the SimTraffic results, the intersection is operating at LOS D during the AM and PM peak hours and all individual movements are operating at LOS E or better during the AM and PM peak hours.

Northbound Southbound Eastbound Westbound PK (Delay/LOS) (Delay/LOS) (Delay/LOS) (Delay/LOS) HR LT TH RT LT TH RT LT TH RT LT TH RT 62.0/E 58.6/E 44.9/D 36.6/D 25.2/C 11.1/B 59.4/E 30.2/C 11.6/B 26.8/C 41.7/D 20.9/C AM 58.2/E 23.9/C 44.3/D 34.2/C 44.9/D 43.8/D 24.9/C 16.6/B 45.2/D 33.4/C 20.3/C 51.6/D 56.2/E 34.8/C 62.0/E 57.7/E 22.7/C PM25.1/C 32.3/C 52.0/D 54.3/D 41.6/D

TABLE 2: EXISTING CONDITIONS CAPACITY ANALYSIS SUMMARY

Mitigation Plan

Kimley-Horn, working with Starbucks staff, have developed two revised site plans that help in addressing the current operational concerns of the development; an interim plan and a long-term plan. The first plan can be implemented with only some striping modifications and is proposed to be completed within two (2) to three (3) weeks from City approval. The second plan, the long-term solution, will require reconstruction of the parking lot and is anticipated to be completed within six (6) to nine (9) months, pending weather conditions and City approvals. Both plans are attached to this memorandum.

Proposed Interim Site Plan

The interim plan proposes to restripe the parking spaces along the east side of the building from 90 degree to angled. This will allow for quicker entering and exiting of the parking space, which in return will reduce the impact of the drive-through operations. This will result in a loss of two (2) parking spaces onsite. Onsite parking is still in excess of minimum City code requirement.

Striping will be provided to guide entering vehicles to queue for the drive-through along the far east drive aisle. This will provide a drive aisle between the parking spaces and the drive-through queue, which at peak times could serve as additional queue storage, essentially creating a dual lane drive-through. Upon exiting the drive-through, all vehicles will be guided (through signage) to exit the site via Marshall Avenue eastbound.

With these changes, it is anticipated that the site can store up to ten (10) vehicles when utilizing the single drive-through lane, and up to fourteen (14) vehicles when utilizing the dual lane drive-through.

Proposed (long-term) Site Plan

In addition to the restriping of the interim modifications above, the long-term plan proposes to shift the drive-through queue further south to provide more on-site storage. With the new drive-through layout, the site can be expected to provide twelve (12) vehicle storage on site.

Overall, the site will provide ten (10) spaces with the proposed changes, which is a reduction of four (4) spaces total. In order to make up the loss of on-site parking spaces, Starbucks is proposing to provide up to six (6) on street public parking spaces along the south side of Marshall Avenue, east of the site driveway. The public on street parking on Marshall Avenue can be added without modifying or affecting the westbound lane striping.

Summary

Starbucks has been working closely with the City of Saint Paul to come up with solutions to the current over-performing operating conditions. Plans have been developed as part of this process to provide additional on-site storage of queueing drive-through vehicles.

Based on the site observations and data collection, the maximum drive-through queue was twelve (12) vehicles. With the proposed changes to the site layout, it can be expected that all twelve (12) vehicles will have the ability to queue on site without impacting the operations of Marshall Avenue.

MEMORANDUM

To: David Kuebler - City of Saint Paul Public Works

Josh Williams - City of Saint Paul PED

From: Douglas Arnold, P.E. and Trisha Sieh, P.E.

Kimley-Horn and Associates, Inc.

Date: January 8, 2018

Re: Addendum to November 2, 2017 Traffic Operations Summary

Starbucks (Snelling Avenue and Marshall Avenue)

Saint Paul, Minnesota

Starbucks has recently implemented interim site plan changes to help better circulate traffic into and out of the store located on the southeast corner of Snelling Avenue & Marshall Avenue in the City of Saint Paul, MN. As discussed with City staff, the following changes were implemented: restripe the parking spaces and drive-aisle on the east side of the site to angled parking to create one way site circulation, improve parking maneuvering times, and allow for a dedicated drive-through queue lane on the far east side of the site.

In order to assess the site circulation as a result of the interim site plan changes, a traffic count was performed on Monday, December 18, 2017 in order to quantify the number of vehicles entering/exiting the site, the amount of queueing that is occurring, and the circulation of exiting traffic during the AM peak period. Mondays and Fridays are typically the busiest days for Starbucks. It should be noted that a traffic officer was on site during the time the traffic counts were collected.

- Based on the traffic counts performed in September 2017, the site generated approximately 160 AM peak hour trips (80 entering, 80 exiting). Based on the December 2017 count, the site is generating 170-180 AM peak hour trips (+/- 10% fluctuation in traffic can be expected based on customer travel patterns and desires). Therefore, the interim site plan changes appear to not have generated a significant increase in site traffic.
- Based on the September 2017 counts, the maximum queue observed was twelve vehicles.
 With the interim site plan changes in place, the maximum queue was observed to be eleven vehicles.
- Based on the December 2017 counts, approximately 70% of the site traffic exited via Marshall Avenue. Of the traffic exiting onto Marshall Avenue, only 5% made the prohibited left-turn.

With the above information, it appears that the interim site plan changes have not lead to a substantial increase in traffic generated by the development or vehicle queueing. Also, the Marshall Avenue exit is most predominately used and non-compliance of the restricted left-turn onto Marshall Avenue was limited.

ATTACHMENT B: Drive-Through Queue Summary

SPILLBACK ONTO MARSHALL AVENUE QUALITATIVE SUMMARY

- Option 1
 - o Monday 04/02/2018
 - 7AM to 8AM
 - Event # 1 Total Time = 1 minute 7 seconds
 - o 7:27:28 to 7:27:49 (21 seconds)
 - One vehicle queued on Marshall but there was still plenty of space for it to fit on site
 - 7:27:49 to 7:28:06 (17 seconds)
 - Vehicle queued on Marshall causes two more vehicles traveling straight to be blocked on Marshall
 - o 7:28:06 to 7:28:35 (29 seconds)
 - One vehicle halfway in the driveway and still blocking the bike lane (there is room for the vehicle, the vehicle in front is not pulling up close enough to the next vehicle)
 - Event # 2 Total Time = 4 minutes 58 seconds
 - o 7:43:29 to 7:43:40 (11 seconds)
 - One vehicle queued on Marshall, site is packed efficiently
 - o 7:43:40 to 7:44:32 (52 seconds)
 - Queue on Marshall increased to two vehicles, site is still packed efficiently and the driveway queue hasn't moved
 - o 7:44:32 to 7:44:53 (21 seconds)
 - Queue increased to six vehicles that are queuedback into the intersection (mix of vehicles visiting the site and through traffic)
 - o 7:44:52 to 7:45:34 (42 seconds)
 - Queue reduced to five vehicles on Marshall and intersection is not blocked anymore
 - o 7:45:34 to 7:46:02 (28 seconds)
 - Queue reduced to four vehicles on Marshall
 - o 7:46:02 to 7:46:46 (44 seconds)
 - Queue reduced to one vehicle on Marshall
 - o 7:46:46 to 7:48:06 (80 seconds)
 - Queue increased to two vehicles on Marshall
 - 7:48:06 to 7:48:27 (21 seconds)
 - Queue reduced to one vehicle halfway in the driveway still blocking the bike lane
 - Event # 3 Total Time = 41 seconds
 - o 7:50:14 to 7:50:55 (41 seconds)
 - Two vehicles queued on Marshall, site is packed efficiently
 - 8AM to 9AM No Events
 - 9AM to 10AM No Events

- Tuesday 04/03/2018 (Afternoon Snow Storm)
 - 7AM to 8AM
 - Event # 1 Total Time = 25 seconds
 - o 7:40:55 to 7:41:20 (25 seconds)
 - Two vehicles queued onto Marshall, site packed efficiently
 - 8AM to 9AM No Events
 - 9AM to 10AM
