How to Read Your Meter

You will need a flashlight to read this meter.

- **Light Sensor**
  Shine a flashlight to turn on display panel.

- **Flow Indicator**
  Visible only when water is running.

- **Display Panel**
  Read the numbers from left to right to provide a water meter reading.
Every six seconds, the display panel will alternate between the rate of flow (top) and total water use.

**Rate Indicator** “RATE” means it is displaying the rate of water flow measured in cubic feet per minute.

This shows 0.393 cubic feet of water per minute flowing through the meter. To determine gallons per minute, multiply by 7.48.

$$0.393 \text{ cu.ft. min.} \times 7.48 = 2.94 \text{ gal. per min.}$$

In 10 minutes, 29.4 gallons of water will pass through this meter. **Hour: 176.4 gallons; Day: 4,233 gallons; Month: 131,225 gallons.**

**Leak Indicator**

An image of a faucet indicates a leak. **No faucet** indicates no leak.
